## INTRODUCTION

This report summarizes data compiled from the original records/reports that were filed with the Bureau of Vital Statistics (VS) as required by law. These include records/reports of live births, deaths, fetal deaths, marriages, and dissolutions of marriage. Standard forms recommended by the US Public Health Conference on Records and Statistics are for the most part used for records of live birth, death, and fetal death.

Responsibility for filing birth records lies with the physician, midwife, or other attendant. Funeral directors, or other persons acting as such, are legally charged with filing death and fetal death (20 or more weeks of gestation) records. These documents are then submitted to local registrars who, in turn, forward them to VS. Marriage and dissolution records are received by VS directly from the various courts.

### **HISTORICAL BACKGROUND:**

This marks the 95th year this annual publication has been produced which began in 1919. The earliest birth on file with the Bureau of Vital Statistics is from 1865. The earliest death on file with the Bureau of Vital Statistics is from 1877. Statewide collection of birth and death records first began in 1917 and the mandate to collect these data statewide was addressed again in 1927.

Having met all United States Bureau of the Census criteria, Florida became a nationally recognized death registration jurisdiction in 1919 and a nationally recognized birth registration jurisdiction in 1924. Marriage and dissolution records have been filed with the Bureau of Vital Statistics since June 1927.

### **COMPLETENESS AND QUALITY OF DATA:**

Tabulation of data for this annual report was begun after allowing a reasonable time for receipt of late documents. A few records/reports are received after tabulation and thus are not included. These records/reports represent a very small fraction of the total, and their omission does not materially alter the facts presented. The quality of data presented in this Annual Report is directly related to the completeness, accuracy, and processing associated with the source documents, registration procedures, and statistical reporting systems.

### **AVAILABILITY OF DATA:**

This publication can be accessed at <http://www.flpublichealth.com/VSBOOK/VSBOOK.aspx>. In addition to these published tables, charts, and graphs additional supplemental tables showing selected data in greater detail are also included on this website. Special statistical data files are available upon request on a fee-for-service basis.

### **RESIDENT AND RECORDED EVENTS:**

Data on births and deaths are tabulated according to both the usual "place of residence" (events occurring to Florida residents regardless of the place of occurrence) and the "place of occurrence" (events occurring in Florida regardless of the usual place of residence). The former are referred to as "resident" events and the latter as "recorded" events. Prior to 1933 only recorded data are available.

Varying interpretations of the "usual place of residence" by Florida's many seasonal visitors and military families may influence the accuracy of resident tabulations to some extent, since the residence shown on the record is normally accepted without question. For births and fetal deaths, the mother's residence is always used.

Data on marriages are based on county of marriage record issuance. Data on dissolution of marriage records are by place of occurrence only; there is no interstate exchange of these records. However, Florida dissolutions of marriage are granted only to legal residents.

## **POPULATION:**

The resident midyear July 1 population estimates for 2001-2013 used in this Annual Report were developed by the Department of Health, Division of Public Health Statistics and Performance Management in consultation with the Florida Legislature's Office of Economic and Demographic Research (s. 216.135, Florida Statutes). Following a census, it is customary to revise population projections for the intercensal years based on information from the latest census. Replacing the projected population data with actual estimates ensures accurate accounting of the racial, ethnic, gender, and age distribution of the population. Without these revisions, rates would appear to dramatically change between 2001 and 2013 for no reason other than incomparable population estimates.

## **RACE:**

Since 1989, the National Center for Health Statistics (NCHS) has classified live births and fetal deaths according to the race of the mother only. As a result of this change and for purposes of comparability, vital statistics data in this report have been modified and are based on the race of the mother for all live birth and fetal death data. In examining trends for related indicators such as infant deaths, low birthweight, and unwed births, it is important to use the same race methodology throughout the time period being analyzed. As a result of the change in methodology from the use of the race of the child/fetus to the use of the race of the mother, some of the black and other race births or fetal deaths (based on the race of child/fetus) will now be classified as white births (based on the race of the mother). This change may result in a slight decrease in the white infant death rate and an increase in the black and other race infant death rate.

According to the U.S. Census Bureau, "Race and ethnic questions are among the most technically complex and publicly controversial questions asked in the decennial census." Over the past three decades, the Census Bureau's definitions and coding procedures have changed. The 1970 Census for Florida showed a population that was 84.3 percent white, 15.3 percent black, and 0.4 percent for all other races. The 1980 Census showed 84.0 percent white, 13.8 percent black, and 2.2 percent for all other races. This increase in the races other than white and black results mainly from changes in the Census Bureau's definitions. After 1980, the Census Bureau corrected its data and many persons, primarily white Hispanics who had been listed as "others", were reclassified to white. Revised 1980 data for Florida had 85.4 percent white, 13.8 percent black, and 0.8 percent for all other races.

Race entries usually are tabulated as stated on the birth, death, fetal death and marriage certificates. However, designations such as "Hispanic" are generally classified as "white." Designations such as "bi-racial," "black and other race," or "mixed" are classified as "other entries." The 2000 Census permitted multiple responses to be made for the question regarding race. When the Florida Bureau of Vital Statistics revised its birth certificate for the 2004 data year, its death certificate for the 2005 data year and its fetal death certificate for the 2006 data year, the new certificates also permitted multiple responses to be made for the race question. There are 15 race designations from which any number may be chosen. For tabulation purposes, frequency counts for each of the 15 designations indicate that only a single selection was made. When the single category "other" was selected and a black Hispanic designation was specified, the race was classified as "black." Otherwise, "other" with a Hispanic designation was classified as "white." When "white" and "black" are displayed in the data tables, they represent "only white race" and "only black race", respectively. When "other" is displayed in the data tables it represents "only a race other than white or black" or "multiple races."

## **UNKNOWN:**

Data in this publication may include persons whose age, race, gender, or resident county/city may be unknown or not reported. As a result, the totals for these data may be greater than the sum of the components.

## CAUSE OF DEATH:

The underlying cause of death is determined from death certificate medical information in accordance with procedures established by the World Health Organization (WHO) and NCHS. Standardized codes are assigned from the International Classification of Diseases (ICD). To keep abreast of changes in medical knowledge, the ICD is revised approximately every 10 to 15 years. Revisions and years used in Florida are:

<u>Revision</u>	<u>Years</u>	<u>Revision</u>	<u>Years</u>
Second .....	1917-1920	Seventh .....	1958-1967
Third .....	1921-1929	Eighth .....	1968-1978
Fourth .....	1930-1940	Ninth .....	1979-1998
Fifth .....	1941-1948	Tenth.....	1999-Present
Sixth .....	1949-1957		

Due to these revisions, some of which involve major changes, year-to-year comparisons of deaths by cause can be misleading, unless such comparisons span a period of years in which only one revision was used, or in which the changes from one revision to another were minor.

The Tenth Revision contains major modifications in many sections. Under the Tenth Revision, a disease category such as “pneumonia/influenza” may be redefined so that more or fewer deaths are included in that classification. To permit more accurate comparisons, NCHS coded a sample of 1996 US deaths by both the Ninth and Tenth Revision rules. The results were grouped by major causes and, for each of these; the number of Tenth Revision deaths was divided by the number of Ninth Revision deaths to produce a comparability ratio. For example, the comparability ratio for Malignant Neoplasm is 1.0068. This means the Tenth Revision coding of 10,000 death certificates will produce about 68 more malignant neoplasms than the Ninth Revision coding would. The comparability ratios for 113 selected causes of death and the 130 selected causes of infant death may be found in the National Vital Statistics Report, Vol. 49, No. 2, May 18, 2001 available at [http://www.cdc.gov/nchs/data/nvsr/nvsr49/nvsr49\\_02.pdf](http://www.cdc.gov/nchs/data/nvsr/nvsr49/nvsr49_02.pdf).

## AGE-ADJUSTED DEATH RATE (AADR):

The Age-Adjusted Death Rate (AADR) is a summary rate of deaths that facilitates the comparability of rates for areas or population subgroups with different age distributions. These rates are presented as per 1,000 or 100,000 population. The AADRs published in this report are the rates that would have been observed if the age-specific death rates for the given year had prevailed in a population whose age distribution was the same as that of the standard population. Through 1960 the population of the United States in 1940 was used as a standard for computation of the AADRs using the direct method. For 1970 and forward, the projected 2000 standard million population of the United States is used as a standard for computation of the AADRs using the direct method. The specified age intervals are under 1, 1-4, 5-14, 15-24, 25-34, 35-44, 45-54, 55-64, 65-74, 75-84, and 85 years or older for the years 1970 through 2013.

## COMPUTATIONS AND FOOTNOTES:

The following procedures and symbols are used throughout this report:

- (1) All rates and ratios are rounded to the nearest tenth.
- (2) Undefined/anomalous rates/ratios (those with denominators of zero) are printed as “—.”
- (3) For 1990 and forward, Age-Adjusted Death Rates (AADRs) are standardized using the direct method of standardization, to the US 2000 standard million population.
- (4) "NA" is an abbreviation for not available.

## RATES AND FORMULAE

**Age-adjusted death rate (AADR):** Number of deaths occurring among a population adjusted to the projected 2000 standard million population of the United States using the direct method. An AADR is used to control for differences when comparing two or more populations or the same populations over time.

Sum of the products of age-specific death rates with standard population proportion

**Age-specific rate:** Number of events occurring to a specific age group per 1,000 or 100,000 population of the specified age group.

$$\frac{\text{Number of events to specific age group} \times 1,000 \text{ (or } 100,000\text{)}}{\text{Estimated midyear population of specific age group}}$$

**Cause specific death rate:** Number of deaths due to a specific cause per 100,000 population.

$$\frac{\text{Number of deaths from a specific cause} \times 100,000}{\text{Estimated midyear population}}$$

**(Crude) birth rate:** Number of live births per 1,000 population.

$$\frac{\text{Number of live births} \times 1,000}{\text{Estimated midyear population}}$$

**(Crude) death rate:** Number of deaths per 1,000 population.

$$\frac{\text{Number of deaths} \times 1,000}{\text{Estimated midyear population}}$$

**(Crude) divorce rate:** Number of divorces per 1,000 population.

$$\frac{\text{Number of divorces} \times 1,000}{\text{Estimated midyear population}}$$

**(Crude) marriage rate:** Number of marriages per 1,000 population.

$$\frac{\text{Number of marriages} \times 1,000}{\text{Estimated midyear population}}$$

**Fetal death rate:** Number of fetal deaths (20 weeks or more gestation) per 1,000 live births plus fetal deaths.

$$\frac{\text{Number of fetal deaths} \times 1,000}{\text{Number of live births} + \text{number of fetal deaths}}$$

**Fertility rate:** The total number of births in a year per 1,000 female population, aged 15-44 years.

$$\frac{\text{Number of live births} \times 1,000}{\text{Estimated midyear female population aged 15-44 years}}$$

**Infant mortality rate:** Deaths to individuals less than one year old per 1,000 live births.

$$\frac{\text{Number of infant deaths} \times 1,000}{\text{Number of live births}}$$

**Maternal mortality rate:** Number of deaths to women while pregnant or within 42 days of termination of pregnancy, irrespective of the duration and site of the pregnancy, from any cause related to or aggravated by the pregnancy or its management, but not from accidental or incidental causes (ICD-10: A34, O00-O95, O98-O99) per 100,000 live births.

$$\frac{\text{Number of maternal deaths} \times 100,000}{\text{Number of live births}}$$

**Natural increase:** The difference between the number of live births and the number of deaths.

$$\text{Number of live births} - \text{number of deaths}$$

**Neonatal mortality rate:** Deaths to individuals less than 28 days old per 1,000 live births.

$$\frac{\text{Number of deaths} < 28 \text{ days} \times 1,000}{\text{Number of live births}}$$

**Percent live births to unwed mothers:** Percent of unwed live births to the total number of live births.

$$\frac{\text{Number of live births to unwed mothers} \times 100}{\text{Number of live births}}$$

**Percent low birth weight:** Percent of live births weighing less than 2,500 grams to the total number of live births.

$$\frac{\text{Number of low weight live births} \times 100}{\text{Number of live births}}$$

**Percent very low birth weight:** Percent of live births weighing less than 1,500 grams to the total number of live births.

$$\frac{\text{Number of very low weight live births} \times 100}{\text{Number of live births}}$$

**Perinatal mortality rate:** Fetal deaths (20 weeks or more gestation) plus neonatal deaths (occurring in the first 27 days of life) per 1,000 live births plus fetal deaths.

$$\frac{\text{Number of fetal deaths} + \text{number of neonatal deaths} \times 1,000}{\text{Number of fetal deaths} + \text{number of live births}}$$

**Post-neonatal mortality rate:** Number of infant deaths of age 28 through 364 days per 1,000 live births.

$$\frac{\text{Number of infant deaths aged 28 through 364 days} \times 1,000}{\text{Number of live births}}$$

**Note:** Although totals may include persons whose age, race, gender, or resident county/city is unknown, the process of "imputation" (using an algorithm to assign a known value to an unknown value) is not used to assign age, race, gender, or resident county/city in calculating any rate, ratio, or percentage.

Source: The Florida Legislature, Office of Economic and Demographic Research, July 1 estimates or births and infant deaths from the Bureau of Vital Statistics.

1. The <1 age group is number of births minus infant deaths obtained when in-state births and infant deaths were finalized plus the number of out-of-state births minus infant deaths from the previous calendar year. When the estimate of individuals <1 in a county exceeds the 0-4 population estimate from the Office of Economic and Demographic Research for the county, then the county's total 0-4 population estimate is reallocated based on the proportion of individuals <1 in each race, ethnic, gender group in relation to the total number who are <1 in the county. A final adjustment may have been made to the <1 estimate to ensure that the sum of the <1, 1, 2, 3, and 4 age groups total to the county's 0-4 population estimate.

2. The 1-4 age group for each county is the Office of Economic and Demographic Research 0-4 age group estimate minus the <1 age group estimate described in the previous footnote. A final adjustment may have been made to the 1-4 estimate to ensure that the sum of the <1, 1, 2, 3, and 4 age groups total to the county's 0-4 population estimate.

Source: The Florida Legislature, Office of Economic and Demographic Research, July 1 estimates or births and infant deaths from the Bureau of Vital Statistics.

1. The <1 age group is number of births minus infant deaths obtained when in-state births and infant deaths were finalized plus the number of out-of-state births minus infant deaths from the previous calendar year. When the estimate of individuals <1 in a county exceeds the 0-4 population estimate from the Office of Economic and Demographic Research for the county, then the county's total 0-4 population estimate is reallocated based on the proportion of individuals <1 in each race, ethnic, gender group in relation to the total number who are <1 in the county. A final adjustment may have been made to the <1 estimate to ensure that the sum of the <1, 1, 2, 3, and 4 age groups total to the county's 0-4 population estimate.

2. The 1-4 age group for each county is the Office of Economic and Demographic Research 0-4 age group estimate minus the <1 age group estimate described in the previous footnote. A final adjustment may have been made to the 1-4 estimate to ensure that the sum of the <1, 1, 2, 3, and 4 age groups total to the county's

# Live Births

## LIVE BIRTHS

- Since 1970, Florida's resident live births have increased. The largest increase was between 1980 and 1990, when births increased from 131,811 to 199,146. Between 2000 and 2010, births increased from 204,030 to 214,519. Further analysis of this decade shows gains in the number of births until 2007, when the highest number (239,120) was reached. In 2013, the number of resident live births increased to 215,194, after decreasing for five consecutive years.
- In 2013, Florida experienced a birth rate of 11.1 births per 1,000 population. This is a decrease of 0.9 percent from the 2012 rate of 11.2.
- In 2013, the resident birth rate for whites was 10.1 births per 1,000 population and 15.2 births per 1,000 population for blacks.
- Both the number and percentage of resident births to mothers aged 18 and under decreased between 2012 and 2013. The number decreased from 8,885 to 7,660 and the percent from 4.2 to 3.6.
- Comparing the percentage of resident births to mothers of 18 years or younger by race, the percent for black mothers (5.4 percent) is 1.7 times higher than the percent for white mothers (3.1 percent).
- Between 2012 and 2013, the percent of resident live births with birthweights less than 2,500 grams (5 lbs. 8.2 oz.) decreased from 8.6 to 8.5. The percent of resident live births with birthweights less than 1,500 grams (3 lbs. 4.9 oz.) was also decreased from 2012 to 2013 at 1.5. The percent of resident live births with birthweights of 4,000 grams (8 lbs. 13.1 oz.) and heavier was 6.9 in 2013, the same as in 2012.
- About 12 out of every 25 resident live births (48.0 percent) were to unwed mothers. For blacks, about twelve out of every seventeen births (70.7 percent) were to unwed mothers. Among whites, about eight out of every nineteen births (42.5 percent) were to unwed mothers. Among other races, approximately five out of every seventeen live births (29.5 percent) were to unwed mothers.
- Of the live births to unwed mothers, 7.0 percent were to women 18 years old and younger.
- Mothers of Hispanic origin accounted for 27.5 percent of the resident live births.
- The majority of infants born during 2013 had a white mother (71.2 percent of Florida's total resident live births). About twenty-three percent had a black mother and the mother of 5.7 percent were of other race.
- Of the resident live births, 97.9 percent occurred in hospitals. Physicians attended 89.2 percent of the hospital births.

1. Starting in 2004, "trimester prenatal care began" is calculated as the time elapsed from the date of the last menstrual period to the date of the first prenatal care visit. Prior to 2004, these data were obtained by direct question that noted the trimester the mother began prenatal care. Consequently, these data are not comparable to data from prior years.

2. Births with unknown information as to when prenatal care began are excluded from the denominator.

Prior to 2004, these data were obtained by direct question that noted the trimester the mother began prenatal care. Consequently, these data are not comparable to data from prior years.

2. Births with unknown information as to when prenatal care began are excluded from the denominator.

# **Fetal and Infant Deaths**

## FETAL DEATHS AND INFANT DEATHS

- The number of resident fetal deaths (stillbirths occurring at 20 or more weeks of gestation) increased by 3 from 1,530 in 2012 to 1,533 in 2013. The rate was unchanged at 7.1 per 1,000 live births from 2012 to 2013.
- Between 2012 and 2013, resident fetal deaths increased among whites from 822 to 869, decreased among blacks from 626 to 579, and increased by 4 for other races from 77 to 81.
- Of all resident fetal deaths in 2013, 68.5 percent were to mothers of non-Hispanic and non-Haitian origin, 21.4 percent were to mothers of Hispanic origin, 6.5 percent were to mothers of Haitian origin and 3.6 percent were to mothers whose ethnicity was unknown.
- Between 2012 and 2013, the neonatal death rate increased slightly from 3.9 per 1,000 live births to 4.0 per 1,000 live births. The 2013 rate represents less than half the rate of 1980 (9.7 per 1,000 live births) and one quarter of the rate from 1970 (16.0 per 1,000 live births).
- Between 2012 and 2013, the black neonatal death rate increased from 6.6 per 1,000 live births to 7.0 per 1,000 live births. The black neonatal death rate (7.0 per 1,000 live births) is more than twice the white rate (3.0 per 1,000 live births).
- Florida's 2013 infant mortality rate is 6.1 per 1,000 live births. This is an increase after setting a record low in 2012. From 2000 to 2008, the resident infant mortality rate fluctuated between a low of 7.0 per 1,000 live births to a high of 7.5 per 1,000 live births. Between 2009 and 2013 the rate shows a downward trend. The 2013 resident infant mortality rate has dropped 36.5 percent since 1990 and is currently less than half the rate of 1980.
- The resident infant mortality rate increased slightly from 6.0 per 1,000 live births in 2012 to 6.1 per 1,000 live births in 2013. The white infant mortality rate remained unchanged with 4.6 per 1,000 live births in 2012 and 4.6 per 1,000 live births in 2013. The black infant mortality rate slightly decreased from 10.7 per 1,000 live births in 2012 to 10.6 per 1,000 live births in 2013.
- In 2013, resident infant deaths among non-Hispanic and non-Haitian origin accounted for 74.6 percent of all resident infant deaths. Among other ethnic groups, infants of Hispanic origin represented 19.8 percent, infants of Haitian origin represented 3.9 percent and 1.7 percent occurred to infants whose ethnicity was unknown.
- Among all resident infant deaths during 2013, 65.2 percent were neonatal deaths (occurring before infants were 28 days old). Furthermore, 38.0 percent of infant deaths occurred to infants who were less than one day old.
- The most frequent causes of resident infant deaths in 2013 were: 1) Perinatal Period Conditions (674 deaths), 2) Congenital Malformations (236 deaths), 3) Unintentional Injuries (Accidents) (119 deaths), and 4) Sudden Infant Death Syndrome (SIDS) (53 deaths). These causes accounted for 78.3 percent of all resident infant deaths.
