

Deaths

DEATHS

- The International Classification of Diseases Tenth Revision (ICD-10) was used for coding the 1999 through 2004 underlying cause of death. Changes from the previously used ICD-9 to the ICD-10 revision can make year-to-year comparisons misleading. ICD-10 contains major changes, so a greater or fewer number of deaths are now assigned to certain causes than under ICD-9 rules. Causes which changed the most include Alzheimer's disease, syphilis, and pneumonia. See the Introduction section for further explanation and detailed comparability ratios.
- Through 1969 Age-Adjusted Death Rates (AADR) were calculated using the 1940 standard million population. For 1970 and forward, AADR calculations used the projected 2000 standard million population.
- In 2004, Florida resident deaths decreased slightly to 168,364; however, the decrease from 2003 was only 0.1 percent.
- The overall resident death rate per 1,000 population decreased slightly. The rate decreased for white males and females and for nonwhite males and females.
- Of all resident deaths; 89.6 percent were to persons of Non-Hispanic or Haitian origin, 9.4 percent were to persons of Hispanic origin, and 0.6 percent were to persons of Haitian origin and 0.4 percent were to persons whose ethnicity was unknown.
- Among whites, cremations outnumbered burials 53.5 percent to 31.7 percent. For blacks, burials outnumbered cremations 71.2 percent to 19.6 percent. For others, cremations outnumbered burials 51.4 percent to 37.0 percent.
- Heart disease was the leading cause of death -- almost three of every 10 deaths.
- Malignant Neoplasm (Cancer) was the second leading cause of death, accounting for almost one of every four deaths.
- Unintentional Injury (Accident) was the leading cause of death for individuals aged 1-4, 5-9, 10-14, 15-19, 20-24, 25-34, and 35-44, accounting for 31.7 percent of the deaths in these age groups combined.
- There were 28 fewer HIV deaths in 2004 than in 2003 – a 1.3 percent decrease.
- The resident HIV death rate for nonwhite males (39.5 per 100,000 population) is more than the rates for white males, white females and nonwhite females combined.
- HIV was the fifth leading cause of death in persons 25-34 years old and the fourth leading cause of death in persons 35-44 years old – 9.8 percent of the total deaths in these age groups combined.
- The homicide death rate decreased for white males and nonwhite males, but increased for white females and nonwhite females. The rate for nonwhite males was almost double the combined rate for white males, white females, and nonwhite females.
- The major external causes of death (Unintentional Injury, Suicide, and Homicide) accounted for 6.9 percent of all resident deaths.
- Malignant Neoplasm (Cancer) was the leading cause of death for individuals aged 45-54, 55-64, and 65-74 -- 34.4 percent of the total deaths in these age groups combined.

	1994	-	661	506	153	3.8	3.5	4.7	

*Due to change from the 9th to the 10th revision of the International Classification of Diseases (ICD), 1994 categories have been adjusted to be comparable with 2004. National comparability ratios are presented above (and on pages xi-xiii) to adjust for discontinuities between ICD-9 and ICD-10 categorizations and coding.

**The 17 selected leading causes are ranked from most frequently occurring to least frequently occurring. The other significant causes, perinatal period conditions and congenital malformations, were not ranked in this chart.

GRAPH D-2: PERCENT DISTRIBUTION OF RESIDENT RACE-SPECIFIC DEATHS FOR SELECTED LEADING CAUSES, FLORIDA, 2004

* ICD-10 codes associated with each cause of death group are presented on pages (xvii-xix).
