2014 Vital Statistics – Executive Summary

The annual Vital Statistics Report from the Florida Department of Health reveals that Florida is growing in population and in health. A number of key indicators point to progress made in enhancing the quality of life across different parts of Florida's population, as well as areas needing continued attention and improvement.

In 2014, Florida's population reached 19,548,031 residents, a 1.2 percent increase from 2013 and more than double the state's population in 1970. In 2014, 78.2 percent of the population was white, 16.7 percent was black and 24.0 percent was Hispanic. A Florida Resident born in 2014 can expected to live 79.2 years, which is an increase of 8.1 years from the life expectancy in 1970.

In 2014, the number of live births among residents in Florida increased, for the second year in a row, to 219,905. In 2014, Florida experienced a birth rate of 11.2 births per 1,000 population which was a 0.9 percent increase from 2013. Both the number and percentage of resident births to mothers aged 18 and under decreased between 2013 and 2014. Between 2013 and 2014, the percent of resident live births with birthweights less than 2,500 grams (5 lbs. 8.2 oz.) increased from 8.5 to 8.7, and the percent of resident live births with birthweights less than 1,500 grams (3 lbs. 4.9 oz.) also increased from 1.5 to 1.6. About 12 out of every 25 resident live births (47.9 percent) were to unwed mothers.

While the number of resident fetal deaths (stillbirths occurring at 20 or more weeks of gestation) increased by 43 from 1,533 in 2013 to 1,576 in 2014, the rate remained stable at 7.1 per 1,000 live births. Florida's 2014 infant mortality rate is 6.0 per 1,000 live births, matching the previous record low set in 2012. Between 2009 and 2014 the infant mortality rate shows a downward trend. The 2014 resident infant mortality rate has dropped 37.5 percent since 1990 and is currently less than half the rate of 1980. The most frequent causes of resident infant deaths in 2014 were: 1) Perinatal Period Conditions (677 deaths), 2) Congenital Malformations (252 deaths), 3) Unintentional Injuries (Accidents) (119 deaths), and 4) Sudden Infant Death Syndrome (SIDS) (56 deaths). These causes accounted for 83.2 percent of all resident infant deaths.

In 2014, Florida resident deaths increased to 185,038, which was a 2.8 percent increase from 2013. Heart disease was the leading cause of death in 2014, accounting for 43,747 deaths. Cancer was the second leading cause of death in 2014, accounting for 42,330 deaths. In 2014, the major external causes of death (unintentional injury, suicide, and homicide) accounted for 7.1 percent of all resident deaths. There were 57 fewer resident HIV deaths in 2014 than in 2013, representing a 6.1 percent decrease. The HIV age-adjusted death rate per 100,000 population decreased from 4.5 in 2013 to 4.2 in 2014. From 2013 to 2014, the HIV rates decreased among white males, white females, black males and black females.

The number of marriages in Florida increased by 5.6 percent between 2013 (137,127 marriages) and 2014 (145,250 marriages). The marriage rate, per 1,000 population, also increased from 7.1 in 2013 to 7.4 in 2014. The month of May was the most popular month for marriage with 14,506 marriages performed. Of the 79,432 dissolutions of marriage in 2014, over half (57.8 percent) did not affect any minor children. The average length of a dissolved marriage in 2014 was 11.18 years.

INTRODUCTION

This report summarizes data compiled from the original records/reports that were filed with the Bureau of Vital Statistics (VS) as required by law. These include records/reports of live births, deaths, fetal deaths, marriages, and dissolutions of marriage. Responsibility for filing birth records lies with the physician, midwife, or other attendant. Funeral directors, or other persons acting as such, are legally charged with filing death and fetal death (20 or more weeks of gestation) records. The quality of data presented in this Annual Report is directly related to the completeness, accuracy, and processing associated with the source documents, registration procedures, and statistical reporting systems.

RESIDENT AND RECORDED EVENTS:

Data on births and deaths are tabulated according to both the usual "place of residence" (events occurring to Florida residents regardless of the place of occurrence) and the "place of occurrence" (events occurring in Florida regardless of the usual place of residence). The former are referred to as "resident" events and the latter as "recorded" events. Prior to 1933 only recorded data are available.

Varying interpretations of the "usual place of residence" by Florida's many seasonal visitors and military families may influence the accuracy of resident tabulations since the residence shown on the record is normally accepted without question. For births and fetal deaths, the mother's residence is always used.

Data on marriages are based on county of marriage record issuance. Data on dissolution of marriage records are by place of occurrence only; there is no interstate exchange of these records. Florida dissolutions of marriage are granted only to legal residents.

POPULATION:

The resident midyear July 1 population estimates for 2001-2014 used in this Annual Report were developed by the Department of Health, Division of Public Health Statistics and Performance Management in consultation with the Florida Legislature's Office of Economic and Demographic Research (s. 216.135, Florida Statutes).

RACE:

Since 1989, the National Center for Health Statistics (NCHS) has classified live births and fetal deaths according to the race of the mother. As a result of this change and for purposes of comparability, vital statistics data in this report have been modified and are based on the race of the mother for all live birth and fetal death data. In examining trends for related indicators such as infant deaths, low birthweight, and unwed births, it is important to use the same race methodology throughout the time period being analyzed. As a result of the change in methodology from the use of the race of the child/fetus to the use of the race of the mother, some of the black and other race births or fetal deaths (based on the race of child/fetus) will now be classified as white births (based on the race of the mother).

Race entries usually are tabulated as stated on the birth, death, fetal death and marriage certificates. However, designations such as "Hispanic" are generally classified as "white." Designations such as "bi-racial," "black and other race," or "mixed" are classified as "other entries." The 2000 Census permitted multiple responses to be made for the question regarding race. When the Florida Bureau of Vital Statistics revised its birth certificate for the 2004 data year, its death certificate for the 2005 data year and its fetal death certificate for the 2006 data year, the new certificates also permitted multiple responses to be made for the race question. There are 15 race designations from which any number may be chosen. For tabulation purposes, frequency counts for each of the 15 designations indicate that only a single selection was made. When the single category "other" was selected and a black Hispanic designation was specified, the race was classified as "black." Otherwise, "other" with a Hispanic designation was classified as "white." When "white" and "black" are displayed in the data tables, they represent "only white race" and "only black race", respectively. When "other" is displayed in the data tables it represents "only a race other than white or black" or "multiple races."

CAUSE OF DEATH:

The underlying cause of death is determined from death certificate medical information in accordance with procedures established by the World Health Organization (WHO) and NCHS. Standardized codes are assigned from the International Classification of Diseases (ICD). To keep abreast of changes in medical knowledge, the ICD is revised approximately every 10 to 15 years. Revisions and years used in Florida are:

<u>Revision</u>	<u>Years</u>	<u>Revision</u>	<u>Years</u>
Second	1917-1920	Seventh	1958-1967
Third	1921-1929	Eighth	1968-1978
Fourth	1930-1940	Ninth	1979-1998
Fifth	1941-1948	Tenth.....	1999-Present
Sixth	1949-1957		

Due to these revisions year-to-year comparisons of deaths by cause can be misleading, unless such comparisons span a period of years in which only one revision was used, or in which the changes from one revision to another were minor.

The Tenth Revision contains major modifications and a disease category such as “pneumonia/influenza” may be redefined so that more or fewer deaths are included in that classification. To permit more accurate comparisons, NCHS coded a sample of 1996 US deaths by both the Ninth and Tenth Revision rules. The results were grouped by major causes and, for each of these; the number of Tenth Revision deaths was divided by the number of Ninth Revision deaths to produce a comparability ratio. For example, the comparability ratio for Malignant Neoplasm is 1.0068. This means the Tenth Revision coding of 10,000 death certificates will produce about 68 more malignant neoplasms than the Ninth Revision coding would. The comparability ratios for 113 selected causes of death and the 130 selected causes of infant death may be found in the National Vital Statistics Report, Vol. 49, No. 2, May 18, 2001 available at http://www.cdc.gov/nchs/data/nvsr/nvsr49/nvsr49_02.pdf.

AGE-ADJUSTED DEATH RATE (AADR):

The Age-Adjusted Death Rate (AADR) is a summary rate of deaths that facilitates the comparability of rates for areas or population subgroups with different age distributions. These rates are presented as per 1,000 or 100,000 population. The AADRs published in this report are the rates that would have been observed if the age-specific death rates for the given year had prevailed in a population whose age distribution was the same as that of the standard population. Through 1960 the population of the United States in 1940 was used as a standard for computation of the AADRs using the direct method. For 1970 and forward, the projected 2000 standard million population of the United States is used as a standard for computation of the AADRs using the direct method. The specified age intervals are under 1, 1-4, 5-14, 15-24, 25-34, 35-44, 45-54, 55-64, 65-74, 75-84, and 85 years or older for the years 1970 through 2014.

STATE TOTALS:

State totals include individuals whose age, race, gender, or resident county/city is unknown or not reported. As a result, a state total may be greater than the sum of the table rows or columns.

Source: The Florida Legislature, Office of Economic and Demographic Research, July 1 estimates or births and infant deaths from the Bureau of Vital Statistics.

1. The <1 age group is number of births minus infant deaths obtained when in-state births and infant deaths were finalized plus the number of out-of-state births minus infant deaths from the previous calendar year. When the estimate of individuals <1 in a county exceeds the 0-4 population estimate from the Office of Economic and Demographic Research for the county, then the county's total 0-4 population estimate is reallocated based on the proportion of individuals <1 in each race, ethnic, gender group in relation to the total number who are <1 in the county. A final adjustment may have been made to the <1 estimate to ensure that the sum of the <1, 1, 2, 3, and 4 age groups total to the county's 0-4 population estimate.

2. The 1-4 age group for each county is the Office of Economic and Demographic Research 0-4 age group estimate minus the <1 age group estimate described in the previous footnote. A final adjustment may have been made to the 1-4 estimate to ensure that the sum of the <1, 1, 2, 3, and 4 age groups total to the county's 0-4 population estimate.

Source: The Florida Legislature, Office of Economic and Demographic Research, July 1 estimates or births and infant deaths from the Bureau of Vital Statistics.

1. The <1 age group is number of births minus infant deaths obtained when in-state births and infant deaths were finalized plus the number of out-of-state births minus infant deaths from the previous calendar year. When the estimate of individuals <1 in a county exceeds the 0-4 population estimate from the Office of Economic and Demographic Research for the county, then the county's total 0-4 population estimate is reallocated based on the proportion of individuals <1 in each race, ethnic, gender group in relation to the total number who are <1 in the county. A final adjustment may have been made to the <1 estimate to ensure that the sum of the <1, 1, 2, 3, and 4 age groups total to the county's 0-4 population estimate.

2. The 1-4 age group for each county is the Office of Economic and Demographic Research 0-4 age group estimate minus the <1 age group estimate described in the previous footnote. A final adjustment may have been made to the 1-4 estimate to ensure that the sum of the <1, 1, 2, 3, and 4 age groups total to the county's

* Starting in 2004, "trimester prenatal care began" is calculated as the time elapsed from the date of the last menstrual period to the date of the first prenatal care visit. Prior to 2004, these data were obtained by direct question that noted the trimester the mother began prenatal care. Consequently, these data are not comparable to data from prior years.

1. Starting in 2004, "trimester prenatal care began" is the time elapsed from the date of the last menstrual period to the date of the first prenatal care visit. Prior to 2004, these data were obtained by direct question that noted the trimester the mother began prenatal care. Consequently, these data are not comparable to data from prior years.

2. Births with unknown information as to when prenatal care began are excluded from the denominator.
